

HW9

注意！

- 這一次的作業要讓大家練習使用遞迴
- 我們這邊的改作業的時候會判斷是否有使用 recursive，請同學不要改掉已經寫好的 function 名稱以及格式，否則會導致該題0分！
- 這次的作業網路上都找得到答案，同學當然可以參考網路上的 code，但希望同學看完code之後可以寫一份自己的答案
- 若有跟別人一模一樣的code一樣算作弊該題0分！

hw9a

Please implement **sum 1~N** **by using recursive**. You can assume the result of the sum won't overflow.

Input :

Positive *integer* N

Output :

1+2+3+...+N

10
55

hw9b

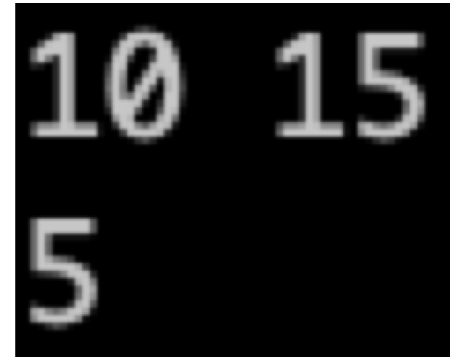

Please find **GCD** (最大公因數) of two positive integers **by using recursive.**

Input :

Two integers

Output :

GCD of the integers you've entered

```
10 15
5
```

hw9c

Please implement **Binary search** by using recursive.

Input :

The first input is the length of your sequence, assume it is smaller than 100. Then enter a non-identical-*integer* sequence. Finally, enter an integer you are looking for.

Output :

Print the index (ascending order) of the number if it is in the sequence. Otherwise, print -1.

Index starts from 0!

Hint :

If you don't know what Binary search is, the following link has explicit explanation :

<https://blog.techbridge.cc/2016/09/24/binary-search-introduction/>

| | | | | |
|----|----|---|----|---|
| 5 | | | | |
| -2 | -3 | 0 | -1 | 1 |
| -4 | | | | |
| -1 | | | | |

| | | | | |
|----|----|---|----|---|
| 5 | | | | |
| -2 | -3 | 0 | -1 | 1 |
| 0 | | | | |
| 3 | | | | |

hw9d

Please implement **Hanoi Tower** by using recursive.

Input :

The number of disks, you can assume it is a positive integer

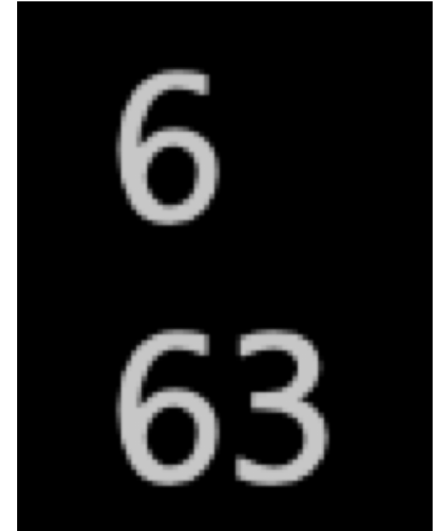

Output :

How many times you have moved the disks

Hint :

Algorithm of Hanoi Tower :

https://www.youtube.com/watch?v=5_6nsViVM00

hw9e

Please implement **Permutation** by using recursive.

Input :

A sequence of *char*, you can assume there are no identical letters.
The length of input sequence is ≤ 9 .

Output :

Every result after permutation. Please output the result in **lexicographical order**. (compare them in ASCII code)

Hint :

Algorithm of permutation

<https://www.youtube.com/watch?v=nYFd7VHKyWQ>

| | | |
|-----|-----|-----|
| -g5 | Aab | 123 |
| -5g | Aab | 123 |
| -g5 | Aba | 132 |
| 5-g | aAb | 213 |
| 5g- | abA | 231 |
| g-5 | bAa | 312 |
| g5- | baA | 321 |

hw9f

Please implement **N Queen Problem** ([Click me for definition](#)) **by using recursive.**

Input :

A positive integer : N, you can assume $N \leq 14$

Which represents : **N** Queens on a **N*N** chessboard

Output :

Number of distinct solutions you can place N queens on a N*N chessboard

Hint :

Timeout is 30 sec, it is fine if your code is not so efficient.
